What Is Farmapram (Alprazolam)?

Last Updated: 07 Feb 2026

Farmapram is the brand name for Alprazolam, a well-known medication belonging to the benzodiazepine class. It's primarily prescribed to manage anxiety disorders, panic attacks, and short-term depressive symptoms associated with anxiety. Alprazolam acts by calming the central nervous system, allowing both mind and body to relax more naturally.

At the molecular level, Farmapram enhances the activity of GABA (gamma-Aminobutyric acid), the brain's primary calming neurotransmitter. Within 20 to 60 minutes, it begins to reduce agitation, slow racing thoughts, and help restore emotional balance — making it a preferred option for fast-acting relief among patients and physicians alike.
